DETAILED ACTION

Examiner's Statement of Reasons for Allowance

1. Claims 1-28 are allowed over prior art.
2. This action is in reply to applicant's correspondence of 25 June 2007.
3. The following is an examiner's statement of reasons for the indication of allowable claimed subject matter.
4. As per claims 1, 20, 23, 26 and 28 generally, prior art of record Gupta et al, U.S. Patent 6,389,532 B1, fails to teach alone, or in combination, at the time of the invention, the features as discussed and remarked upon in the response of 25 June 2007 to office action of 23 March 2007. Specifically, (as per claim 1, for example) prior art dealing with domain information associated with the source of a message across the Internet, being used for authentication using public key cryptography, of the source by the destination, (i.e., DomainKeys identified mail (DKIM) protocols as per a specific utilization in Mdaemon™; Alt-N Technologies, Ltd., 'MDaemon:DomainKeys Identified Mail', Alt-N Technologies, Ltd., May 17, 2004, entire document, <http://www.ebertlang-download.com/alt-n/mdaemon/whitepapers/MDaemon-DKIM.pdf>), is generally known per se. Nowhere in the prior art is found collectively the *italicized* claim elements (i.e., the use of the *policy aspect associated with the originating domain* to authenticate the source, versus the prior art aspect of merely using public key cryptography per se to authenticate the source domain), at the *time of the invention*, serving to patently distinguish the invention from said prior art;

“A method for message authentication, comprising:

generating a key pair associated with a domain,

wherein a public component of the key pair is

accessible to a domain name system (DNS) server that is

associated with the domain;

if a message originates from a sender's address associated with the domain,

employing a private component of the key pair to

digitally sign the message and

forwarding the digitally signed message towards

a recipient of the message; and

if the public component stored with the DNS server verifies that the digitally signed

message originated from the domain associated with the sender's address,

employing at least one policy associated with the originating domain to

handle the verified digitally signed message for

the recipient;

else

handling the message from

another sender's address associated with

an unverified domain.”.

5. Dependent claims 2-19, 21, 22, 24, 25 and 27 are allowable by virtue of their dependencies.

Conclusion

6.
